- Time on Task
- Likert Scale survey responses

Search Results

The screenshot shows the EBSCO search results page for the query 'climate change'. The page displays 144,308 results, sorted by relevance. The top result is 'Phenotypic plasticity and climate change: can polar bears respond to longer Arctic summers with an adaptive fast?' by John P. Whelan, Harry J. Hobbie, George M. Dunner, Eric V. Regal, et al., published in February 2016. Other visible results include 'How issue frames shape beliefs about the importance of climate change policy across ideological and partisan groups' (July 2017) and 'Marine mammals: at the intersection of ice, climate change, and human interactions' (2013). The page includes filters for 'Full Text Online', 'Peer Reviewed', 'Subjects', 'Source Types', 'Last 5 Years', and 'More Filters'. A 'Research Starter' section is also visible on the right side of the results.

User View

A heatmap is overlaid on the search results page, showing areas of high user interest in red and yellow. The most intense heat is concentrated on the title and abstract of the top result, 'Phenotypic plasticity and climate change: can polar bears respond to longer Arctic summers with an adaptive fast?'. Other areas of interest are visible on the 'Research Starter' section and the second result, 'How issue frames shape beliefs about the importance of climate change policy across ideological and partisan groups'.

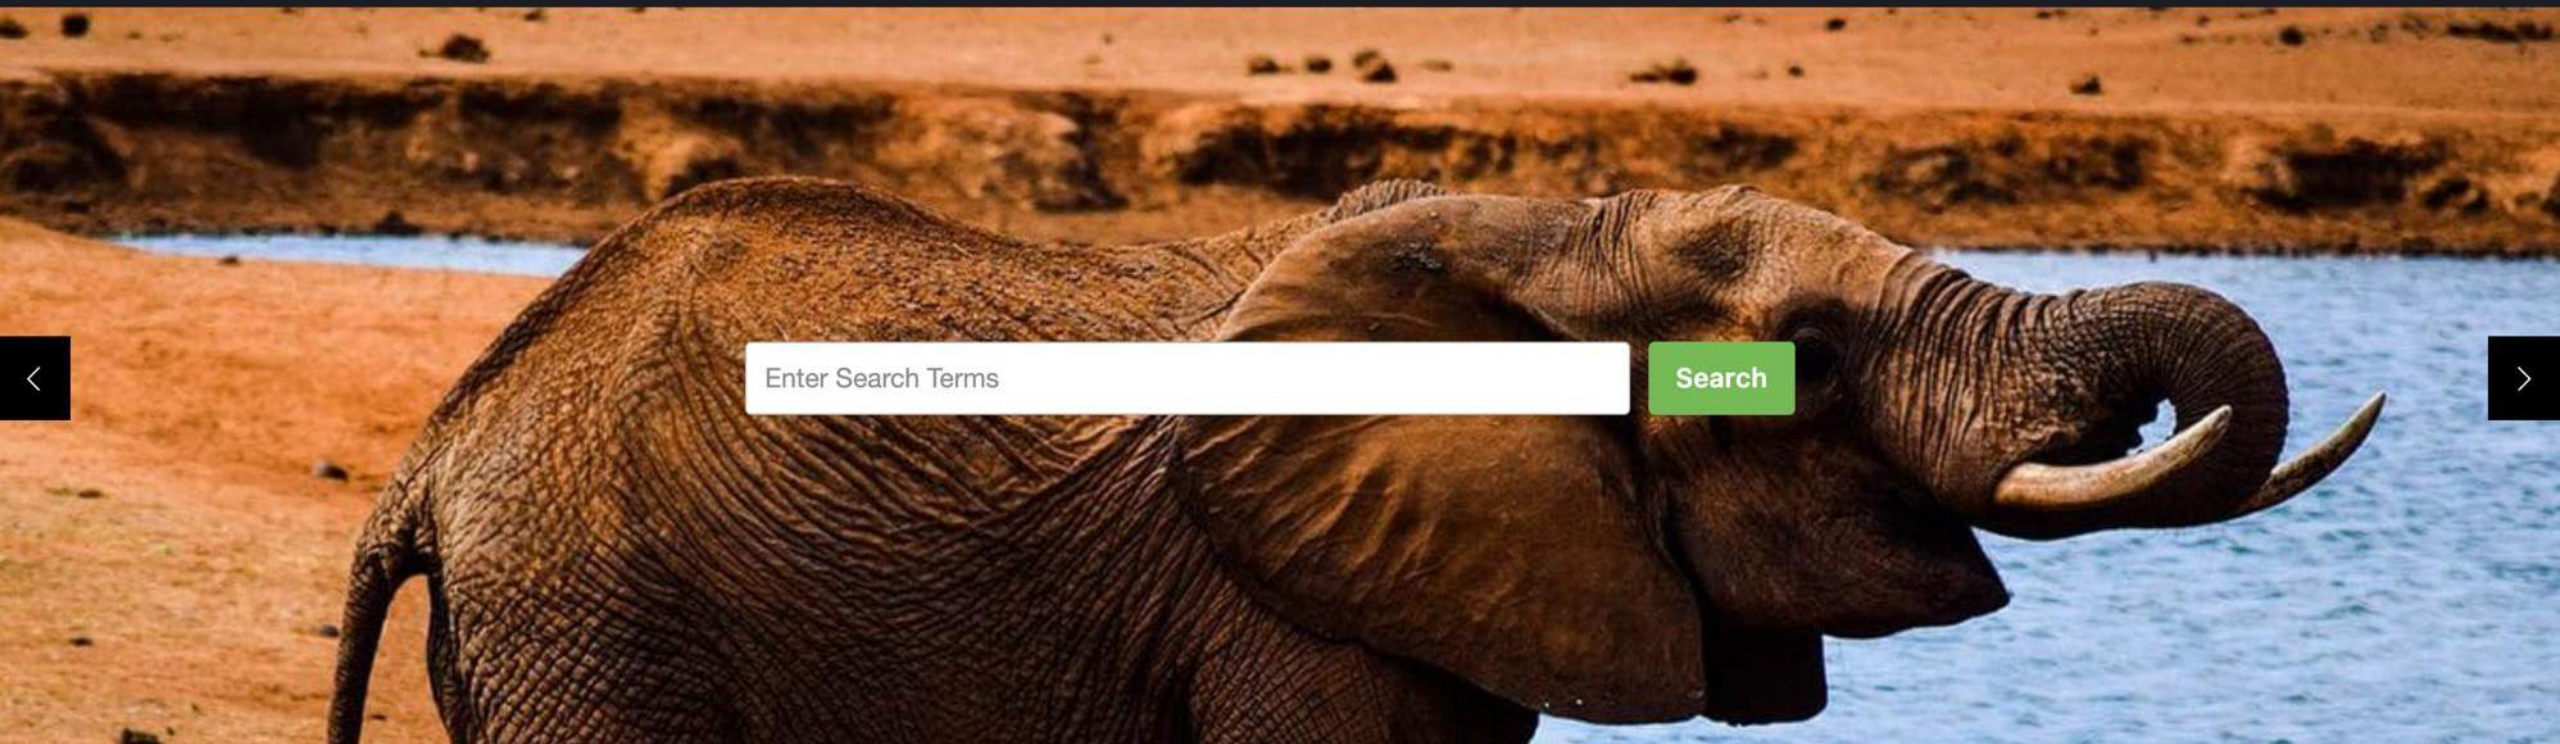

Heatmap

An Areas of Interest Plot is overlaid on the search results page, highlighting specific elements with numbered boxes (1-11) and lines. The plot identifies key areas such as the search bar (1), filters (2), the top result title (3), the abstract (4), the 'Research Starter' section (5), the second result title (6), the 'Read Full Text' button (7), the 'Marine mammals' result title (8), the 'Read Full Text' button for the second result (9), and the 'Shifts in female polar bear' result title (10). The plot also shows time spent on various elements and a 'Time spent' bar at the top right.

Subject Headings:[Global warming](#)[Climate change](#)[Sea level](#)[Glaciers & climate](#)[Thermal expansion](#)[Effect of human beings on climate change](#)**Abstract:**

The basic physics of how global warming contributes to sea-level rise has long been understood, but new research gives us a clearer picture of what to expect. Prior to the 1990s, most sea-level rise was attributed to melting glaciers and the thermal expansion of warming ocean waters. However, ice sheets such as those covering Greenland and Antarctica have also begun to melt and play a significant role in raising ocean levels. The author reviews the results of a number of recent studies. Two of them conclude that the seas could rise by 3 or more feet by the year 2100, and one argued that 5 feet or more by 2100 is a possibility. Exactly what happens, and when, will be influenced by the degree to which humans reduce carbon emissions, and the uncertain dynamics of the Antarctic ice sheet. Considerable sea-level rise will occur as a consequence of the global warming humans have already caused. (ABSTRACT FROM AUTHOR)

 Abstract & Details

 References

The term “Stockholm syndrome” was coined in the context of a six-day hostage and siege situation in central Stockholm in 1973. The term refers to the positive bond and emotional identification that hostages can develop with their captors. In trauma and crisis-management research, those identified as suffering from the syndrome exhibit positive feelings toward their jailors and distrust and anger toward the authorities (de Fabrique, Romano, and Vecchi 2007; Namnyak et al. 2008; Adorjan et al. 2012). In academic studies as well as media discourse and everyday understandings the syndrome is viewed as a psychological crisis response that primarily affects young white women. Today it is primarily associated with the three women in the 1973

1 Future *climate change* scenarios in Central America at high spatial resolution.

The objective of this work is to assess the downscaling projections of climate change over Central America at 8-km resolution using the Eta Regional Climate Model, driven by the HadGEM2-ES simulations of RCP4.5 emission scenario.

Climate Change

Climate change, periodic modification of Earth's climate brought about as a result of changes in the atmosphere as well as interactions between the atmosphere and various other geologic, chemical, biological, and geographic factors within the Earth system. The atmosphere is a dynamic fluid that is continually in motion. Both its physical properties and its rate and direction of motion are influenced by a variety of factors, including solar radiation, the geographic position of continents, ocean currents, the location and orientation of mountain ranges, atmospheric chemistry, and...
